L3 ANSWER 3 OF 4 CABA COPYRIGHT 2003 CABI

AB Of 8 forms of K fertilizers applied to Medicago sativa grown on a serozem soil containing 16 mg available K/100 g soil, potassium sulphate, glaserite and potassium chloride were the most effective; they increased hay yields by 0.8-0.9 t/ha or 25-29%. Potassium sulphate and glaserite increased fresh fodder yield of maize by 9.3-15.5 t/ha. K fertilizers increased the seed cotton yield of cotton by 170-540 kg/ha; **potassium nitrate** was the most effective.

L3 ANSWER 4 OF 4 CABA COPYRIGHT 2003 CABI

AB Samples of 4 grass and 8 legume spp. and castor seeds were distributed among members to compare methods of testing and to provide evidence for the best method. No evidence against previous listed methods was found for Axonopus compressus, Desmodium intortum, D. uncinatum, Macroptilium atropurpureum, Medicago littoralis, M. truncatula, M. scutellata, Panicum maximum and Paspalum plicatulum. M. rugosa should be tested according to the method for M. littoralis. Germination of Brachiaria decumbens seed was greatly stimulated by treatment with conc. sulphuric acid for 13 min. and washing for 2 min. in **potassium nitrate** sol., with the apparent effect of breaking dormancy. Higher germination of Setaria anceps [S. sphacelata var. sericea] was recorded with KNO3 than with water. Results of comparative tests at 3 stations on Glycine wightii [Neonotonia wightii] were too variable for any conclusions to be drawn and variable results were also obtained for Lotononis bainesii. Higher results were obtained in castor at 20-30 deg C than at 25, 30 or 35 deg. Results with **Gossypium hirsutum** were consistently high, indicating that methods could be reduced for this sp., possibly at a single temp. between paper or in sand.
